

Hi Rory,

Hope you are well!

Thanks for bringing this issue to our attention!

We understand that you are experiencing an error code 409 when the two different calls are made from different applications using the same Access Token. We would like to confirm that only one concurrent request per access token is allowed in the synchronous API. If you make two concurrent requests using the same Access Token, you will experience the error 409, which indicates that there is conflict in the request. Therefore, the error you are seeing is indeed the expected behaviour.

In addition to the above, we also would like to emphasize that all the endpoints require the same authorization mechanics, which is using the access token. Thus, you will receive the same error code, when making more than one concurrent request with the same access token, regardless of the endpoint you are using.

Finally, I trust the above is clear and coherent. If you would like to know more about this error, please feel free to visit <https://docs.truelayer.com/#transaction-classification>, and navigate down to the section titled '*Data API reference*'.

Regards,

Cihan
